

Quick Guide to Github - GEFAN

Pedro Dedin Neto

What are Git and Github

- **Git** is a Version Control System (The system that you use to organize the versions of your code)
- **Github** is a specific provider of Internet hosting for software development and version control with Git (Where you can host your code, i.e., its repository)

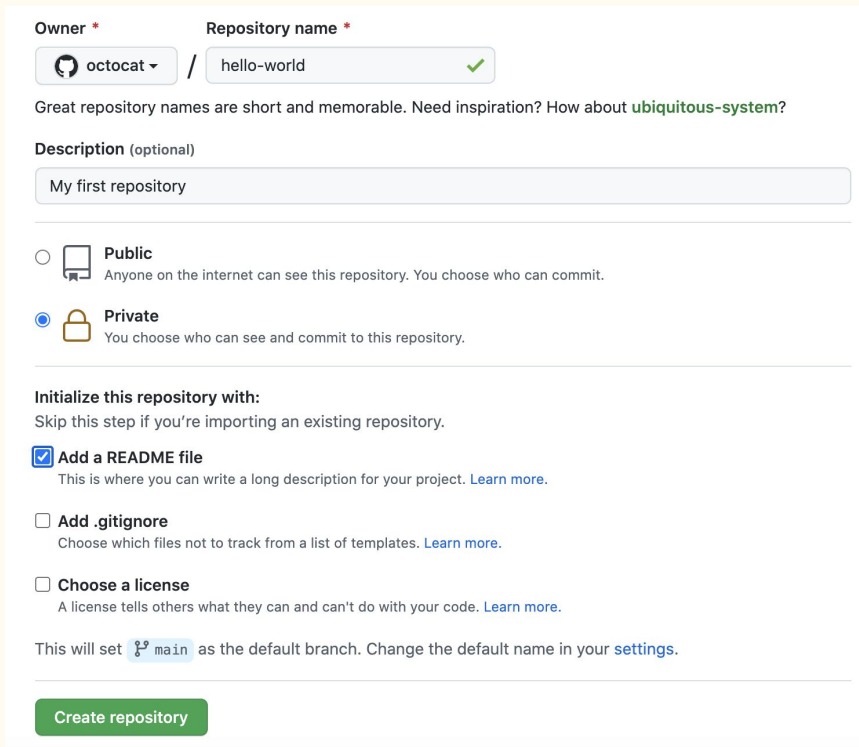

What you need to use them?

- Install git locally on your computer (<https://git-scm.com/>)
- Create an account on Github (<https://github.com/>)

How to create a repository?

- You may create your repository in the Github and make it public or private.

The screenshot shows the GitHub 'Create repository' form. At the top, there are two input fields: 'Owner' with a dropdown menu showing 'octocat' and 'Repository name' with the text 'hello-world' and a green checkmark. Below these is a line of text: 'Great repository names are short and memorable. Need inspiration? How about [ubiquitous-system?](#)'. The 'Description (optional)' field contains the text 'My first repository'. Below the description field are two radio button options: 'Public' (with a lock icon) and 'Private' (with an open lock icon). The 'Private' option is selected. Below these options is a section titled 'Initialize this repository with:' followed by the text 'Skip this step if you're importing an existing repository.' There are three checkboxes: 'Add a README file' (checked), 'Add .gitignore' (unchecked), and 'Choose a license' (unchecked). Each checkbox has a brief description and a 'Learn more' link. At the bottom, there is a line of text: 'This will set `main` as the default branch. Change the default name in your [settings](#).' Finally, at the very bottom, there is a green button labeled 'Create repository'.

Owner * / Repository name *

octocat / hello-world ✓

Great repository names are short and memorable. Need inspiration? How about [ubiquitous-system?](#)

Description (optional)

My first repository

☐ **Public**
Anyone on the internet can see this repository. You choose who can commit.

☒ **Private**
You choose who can see and commit to this repository.

Initialize this repository with:
Skip this step if you're importing an existing repository.

☒ **Add a README file**
This is where you can write a long description for your project. [Learn more.](#)

☐ **Add .gitignore**
Choose which files not to track from a list of templates. [Learn more.](#)

☐ **Choose a license**
A license tells others what they can and can't do with your code. [Learn more.](#)

This will set `main` as the default branch. Change the default name in your [settings](#).

Create repository

Cloning a repository

- You can clone (download) a repository using the following command:

```
git clone "repository link"
```

- It may request username and password if the repository is private.
- Now, you have the code locally on your computer.

Working Flow

Locally, you have 3 different “stages” of you code:

Add

- When you want to add files/modified files to your **stage**, you can use the command:

```
git add <file> or git add *
```

- Now, the files are ready to be committed.

Obs: You may use `git status` to view track which files have been added or not.

Commit

- When you want to commit the files/modified files to your **local** repository, you can use the command:

```
git commit -m "Comments about the changes"
```

- Now, all the committed files are updated in your local repository.
- However, you still didn't send it to your remote repository.

Push

- To send your commits to the **remote repository**, you can use the command:

```
git push origin
```

- Now your remote repository is up to date.

Obs: Some modifications may be needed in this command if you are working in another branch

Pull

- To update your local branch, you may use the following command:

```
git pull
```

- It will **merge** your local files with the remote ones.

Branches

- You can create parallel versions of the code called “Branches” to work in features that may be implemented in the main code, what is called a “Merge”.
- Creating a Branch: `git checkout -b name of the branch`
- Returning to the main branch: `git checkout master`
- To merge your current branch with another: `git merge <branch>`

Organizations

- “Organizations are shared accounts where businesses and open-source projects can collaborate across many projects at once. Owners and administrators can manage member access to the organization's data and projects with sophisticated security and administrative features.” ([Github Docs](#))
- GEFAN's Organization Account: <https://github.com/GEFAN-Unicamp>
- You can create repositories using the organization account or you can allow the account to import your repository to be hosted by it.
